20	<i>Course 1. Topics in string phenomenology, by I. Antoniadis</i>	<i>I</i> 20
21		21
22	1. Introduction	5 22
23	2. Framework of low scale strings	7 23
24	3. Experimental implications in accelerators	8 24
25	3.1. World-brane extra dimensions	8 25
26	3.2. Extra large transverse dimensions	11 26
27	3.3. String effects	13 27
28	4. Supersymmetry in the bulk and short range forces	14 28
29	4.1. Sub-millimeter forces	14 29
30	4.2. Brane non-linear supersymmetry	17 30
31	5. Electroweak symmetry breaking	18 31
32	6. Standard Model on D-branes	21 32
33	6.1. Hypercharge embedding and the weak angle	23 33
34	6.2. The fate of $U(1)$ 's, proton stability and neutrino masses	24 34
35	7. Internal magnetic fields	26 35
36	8. Minimal Standard Model embedding	27 36
37	9. Moduli stabilization	29 37
38	9.1. Supersymmetry conditions	31 38
39	9.2. Tadpole cancellation conditions	34 39
40	9.3. Spectrum	36 40
41	9.4. A supersymmetric $SU(5)$ GUT with stabilized moduli	37 41
42		42

5	<i>Course 2. Orientifolds, and the search for the Standard Model</i>		5
6	<i>in string theory, by Elias Kiritsis</i>	45	6
7			7
8	1. Introduction	49	8
9	2. What we are looking for	54	9
10	3. Classification of bottom-up embeddings	59	10
11	3.1. Orientable configurations	60	11
12	3.2. Charge quantization	65	12
13	3.3. Non-orientable configurations	66	13
14	3.4. The cases $x = -\frac{1}{2}$ or $x = \frac{3}{2}$	67	14
15	3.5. The case $x = 1$	68	15
16	3.6. Realizations with three brane stacks for $x = 0$	69	16
17	3.7. Realizations with three brane stacks for $x = \frac{1}{2}$	70	17
18	3.8. Solutions with type E and F branes	71	18
19	3.9. Solutions with type G branes	72	19
20	4. Statistics of bottom-up configurations	73	20
21	4.1. Three stacks: the $U(3) \times U(2) \times U(1)$ models	73	21
22	4.2. Four stacks: $U(3) \times U(2) \times U(1) \times U(1)'$ models	75	22
23	5. Top-down configurations and SM spectra	80	23
24	5.1. Scope of the top-down search	80	24
25	5.2. Standard model brane configurations found	82	25
26	5.3. Bottom-up versus top-down	85	26
27	5.4. Standard model brane configurations not found	92	27
28	5.5. Higgs, neutrino and mirror distributions	95	28
29	6. Solutions to the tadpole conditions	97	29
30	6.1. Hypercharge embeddings of the tadpole solutions	98	30
31	6.2. Notation	99	31
32	6.3. $U(3) \times U(2) \times U(1)$ models	99	32
33	6.4. Unification	101	33
34	6.5. Curiosities	107	34
35	7. Phenomenological implications and the problem of masses	109	35
36	7.1. Antisymmetric anti-quarks and the problem of quark masses	109	36
37	7.2. Masses in $SU(5)$ and flipped $SU(5)$ vacua and instanton effects	112	37
38	7.3. Family symmetries	114	38
39	7.4. Neutrino masses	116	39
40	8. Dependence of the results on the Calabi–Yau topology	117	40
41	References	119	41

## Contents

1	<i>Course 3. Lectures on supersymmetry breaking,</i>		1
2	<i>by Kenneth Intriligator and Nathan Seiberg</i>	<i>125</i>	2
3			3
4	1. Introduction	129	4
5	2. Semiclassical spontaneous supersymmetry breaking	131	5
6	2.1. The simplest example	132	6
7	2.2. The simplest example but with more general Kähler potential	132	7
8	2.3. Additional degrees of freedom can restore supersymmetry	134	8
9	2.4. An example with a runaway [18]	135	9
10	2.5. O’Raifeartaigh-type models	136	10
11	2.6. Metastable SUSY breaking in a modified O’Raifeartaigh		11
12	model [17]	139	12
13	2.7. Supersymmetry breaking by rank condition [9]	140	13
14	2.8. One-loop lifting of pseudomoduli	142	14
15	2.9. Relation to R-symmetry [11]	149	15
16	3. Supersymmetric QCD	150	16
17	3.1. Super Yang–Mills theory— $N_f = 0$	150	17
18	3.2. Semiclassical SQCD	152	18
19	3.3. Adding large quark mass terms	154	19
20	3.4. $N_f < N_c$ massless flavors [28]	155	20
21	3.5. $N_f = N_c$ massless flavors [29]	156	21
22	3.6. $N_f > N_c$ [33]	157	22
23	3.7. Adding small mass terms	158	23
24	4. Dynamical supersymmetry breaking	159	24
25	4.1. The (3,2) model [38]	160	25
26	4.2. Modified moduli space example [50, 51]	161	26
27	4.3. Metastable states in SQCD [9]	165	27
28	4.4. Naturalizing (retrofitting) models [21, 60]	167	28
29	References	170	29
