Introduction

Exact calculations in supersymmetric gauge theories

- Non-perturbative methods in N = 4 SYM have been developing rapidly
- In particular, two efficient approaches are known:

LocalizationIntegrability BPS, non-planarExample: $\langle W_{circle} \rangle = \frac{2}{\sqrt{\lambda}} I_1(\sqrt{\lambda})$ [Erickson, Semenoff, Zarembo'00], [Drukker, Gross'00],[Pestun'12] IntegrabilityPlanar, Non-BPSExample: tr $[ZD^SZ] \rightarrow \frac{I_1(\sqrt{\lambda})}{I_2(\sqrt{\lambda})}$ [Basso'11]

Is there any non-trivial observable accessible from both approaches?

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Quark-Antiquark Potential/Cusped Wilson Line.

$$W = \operatorname{Tr} \mathcal{P} \exp \int dt \left[iA \cdot \dot{x}_q + \vec{\Phi} \cdot \vec{n} \left| \dot{x}_q \right| \right]$$

Two Wilson line configurations related by a conformal map

 $\mathsf{Conformal\ invariance} \Rightarrow V = \prod_{\mathsf{cusp}} \mathsf{L}_{\mathsf{cusp}} \mathsf{L}_{$

The Cusped Wilson Line: Turning on more parameters

 $\blacksquare \ {\rm Cusp} \ {\rm angle} \ \phi$

- Angle θ between the couplings to scalars on two rays
- R-charge L of a local operator inserted at the cusp
- 't Hooft coupling λ

For $\theta^2 - \phi^2 = 0$ this observable is protected. We will be working in the near-BPS limit $\phi \approx \theta$.

Cusp anomalous dimension is related to a variety of physical quantities, as

- IR divergences of scattering amplitudes, $i\phi$ is a boost angle for massive particles and $i\phi \rightarrow \infty$ for massless.
- Bremsstrahlung function radiation of a moving particle $(\phi \rightarrow 0)$

• The quark-antiquark potential in the flat space ($\phi \rightarrow \pi$)

• For L = 0 the Γ_{cusp} is known from localization

[Correa at al.'12], [Fiol, Garolera, Lewkowycz'12]

$$\Gamma_{\rm cusp}(\lambda) = -\frac{1}{4\pi^2} (\phi^2 - \theta^2) \frac{\sqrt{\lambda} I_2\left(\sqrt{\lambda}\sqrt{1 - \frac{\theta^2}{\pi^2}}\right)}{I_1\left(\sqrt{\lambda}\sqrt{1 - \frac{\theta^2}{\pi^2}}\right)}$$

a arbitrary L, $\theta = 0$, $\phi \ll 1$ — solved in [Gromov, Sever'12] using integrability.

 Γ_{cusp} is expressed through determinants made of $I_n\left(\sqrt{\lambda}\right)$.

• We will get the result for finite $\theta \approx \phi$, arbitrary L and λ from integrability.

The standard method to attack the problem from integrability point of view is TBA

[Bombardelli, Fioravanti, Tateo'09], [Gromov et al'09], [Arutyunov, Frolov'09], [Gromov, Kazakov, Vieira'09], [Correa et al'12],

[Gromov, Sever'12].

$$\begin{split} \log \frac{Y_{1,1}}{\mathbf{Y}_{1,1}} &= K_{m-1} * \log \frac{1 + \overline{Y}_{1,m}}{1 + \overline{Y}_{1,m}} \frac{1 + \mathbf{Y}_{m,1}}{1 + Y_{m,1}} + \mathcal{R}_{1a}^{(01)} * \log(1 + Y_{a,0}) \\ \log \frac{\overline{Y}_{2,2}}{\overline{\mathbf{Y}}_{2,2}} &= K_{m-1} * \log \frac{1 + \overline{Y}_{1,m}}{1 + \overline{Y}_{1,m}} \frac{1 + \mathbf{Y}_{m,1}}{1 + Y_{m,1}} + \mathcal{B}_{1a}^{(01)} * \log(1 + Y_{a,0}) \\ \log \frac{\overline{Y}_{1,s}}{\overline{\mathbf{Y}}_{1,s}} &= -K_{s-1,t-1} * \log \frac{1 + \overline{Y}_{1,t}}{1 + \overline{\mathbf{Y}}_{1,t}} - K_{s-1} * \log \frac{1 + Y_{1,1}}{1 + \overline{Y}_{2,2}} \\ \log \frac{Y_{a,1}}{\overline{\mathbf{Y}}_{a,1}} &= -K_{a-1,b-1} * \log \frac{1 + Y_{b,1}}{1 + \mathbf{Y}_{b,1}} - K_{a-1} * \log \frac{1 + Y_{1,1}}{1 + \overline{Y}_{2,2}} \\ &+ \left[\mathcal{R}_{ab}^{(01)} + \mathcal{B}_{a-2,b}^{(01)} \right] * \log(1 + Y_{b,0}) \end{split}$$

- Infinite system of nlin integral equations for $Y_{a,s}(u)$
- The indices of (a, s) of Y-functions live on a T-shaped hook.
- The energy can be expressed through $Y_{a,0}$

The Y-functions and their near-BPS expansion

In near-BSP limit we expand Y-functions in $\epsilon = (\phi - \theta) \tan \frac{\phi + \theta}{2}$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Simplified TBA

A system for the coefficients of expansion $\Phi, \Psi, \mathcal{Y}_a, \mathcal{X}_a, \mathbb{C}_a$

$$\begin{split} \Phi - \Psi &= \pi \mathbb{C}_a \hat{K}_a(u), \\ \Phi + \Psi &= \mathbf{s} * \left[-2\frac{\mathcal{X}_2}{1 + \mathcal{Y}_2} + \pi (\hat{K}_a^+ - \hat{K}_a^-) \mathbb{C}_a - \pi \delta(u) \mathbb{C}_1 \right], \\ \log Y_{1,m} &= \mathbf{s} * I_{m,n} \log \left(1 + Y_{1,n} \right) - \delta_{m,2} \mathbf{s} \hat{*} \left(\log \frac{\Phi}{\Psi} + \epsilon \left(\Phi - \Psi \right) \right) - \epsilon \pi \mathbf{s} \mathbb{C} \\ \Delta_a &= [\mathcal{R}_{ab}^{(10)} + \mathcal{B}_{a,b-2}^{(10)}] \hat{*} \log \frac{1 + \mathcal{Y}_b}{1 + A_b} + \mathcal{R}_{a1}^{(10)} \hat{*} \log \left(\frac{\Psi}{1/2} \right) - \\ - \mathcal{B}_{a1}^{(10)} \hat{*} \log \left(\frac{\Phi}{1/2} \right), \\ \mathbb{C}_a &= (-1)^{a+1} a \frac{\sin a\theta}{\tan \theta} \left(\sqrt{1 + \frac{a^2}{16g^2}} - \frac{a}{4g} \right)^{2+2L} F(a,g) e^{\Delta_a}, \end{split}$$

 Even simplified in the near-BPS regime system looks nasty, but

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- Even simplified in the near-BPS regime system looks nasty, but
- From localization we know the result at L = 0 is extremely simple $\Gamma_L(g) \sim \tilde{\lambda}^{-1/2} I_2\left(\sqrt{\tilde{\lambda}}\right) / I_1\left(\sqrt{\tilde{\lambda}}\right)$

- Even simplified in the near-BPS regime system looks nasty, but
- From localization we know the result at L = 0 is extremely simple $\Gamma_L(g) \sim \tilde{\lambda}^{-1/2} I_2\left(\sqrt{\tilde{\lambda}}\right) / I_1\left(\sqrt{\tilde{\lambda}}\right)$

• Hope for a drastic simplification?

Step1: From TBA to FiNLIE

Thermodynamical Bethe Ansatz

 ∞ system of nlin integral eqs

$$\begin{split} &\log \frac{Y_{1,1}}{\mathbf{Y}_{1,1}} = K_{m-1} * \log \frac{1 + \overline{Y}_{1,m}}{1 + \overline{\mathbf{Y}}_{1,m}} \frac{1 + \mathbf{Y}_{m,1}}{1 + Y_{m,1}} + \mathcal{R}_{1a}^{(01)} * \log(1 + Y_{a,0}) \\ &\log \frac{\overline{Y}_{2,2}}{\overline{\mathbf{Y}}_{2,2}} = K_{m-1} * \log \frac{1 + \overline{Y}_{1,m}}{1 + \overline{\mathbf{Y}}_{1,m}} \frac{1 + \mathbf{Y}_{m,1}}{1 + Y_{m,1}} + B_{1a}^{(01)} * \log(1 + Y_{a,0}) \\ &\log \frac{\overline{\mathbf{Y}}_{1,s}}{\overline{\mathbf{Y}}_{1,s}} = -K_{s-1,t-1} * \log \frac{1 + \overline{Y}_{1,t}}{1 + \overline{\mathbf{Y}}_{1,t}} - K_{s-1} * \log \frac{1 + Y_{1,1}}{1 + \overline{\mathbf{Y}}_{2,2}} \\ &\log \frac{\overline{Y}_{a,1}}{\mathbf{Y}_{a,1}} = -K_{a-1,b-1} * \log \frac{1 + \overline{Y}_{b,1}}{1 + \overline{\mathbf{Y}}_{b,1}} - K_{a-1} * \log \frac{1 + Y_{1,1}}{1 + \overline{\mathbf{Y}}_{2,2}} \\ &+ \left[\mathcal{R}_{a0}^{(01)} + B_{a-2b}^{(01)}\right] * \log(1 + Y_{b,0}) \end{split}$$

Using the relation between Y-system and integrable Hirota dynamics [Gromov, Kazakov, Vieira'09]

Finite system of nlin integral equations (FiNLIE)

Ansatz for Y-functions through T-functions

$$Y_{1,m} = \frac{T_{1,m}^+ T_{1,m}^-}{T_{1,m+1} T_{1,m-1}} - 1.$$

The general solution for T is given by

$$T_{1,s} = C \begin{vmatrix} Q_1^{[s]} & \bar{Q}_1^{[-s]} \\ Q_2^{[s]} & \bar{Q}_2^{[-s]} \end{vmatrix}$$

.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

The non-trivial part is finding $Q_{1,2}$

The "twisted" ansatz

Our ansatz for $Q_{1,2}$ is

$$Q_1 = \bar{Q}_1 = e^{+\theta(u - iG(u))},$$
$$Q_2 = \bar{Q}_2 = e^{-\theta(u - iG(u))},$$

The resolvent G has a short cut and a series of poles

$$G(u) = \frac{1}{2\pi i} \int_{-2g}^{2g} dv \frac{\rho(v)}{u-v} + \epsilon \sum_{a \neq 0} \frac{b_a}{u-ia/2} .$$

This generates for T-functions

$$T_s = \frac{\sin\left(s - G^{[s]} + G^{[-s]}\right)\theta}{\sin\theta}.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Everything is expressed in terms of $\rho(u), \eta(u), \mathbb{C}_a$

$$\begin{split} \eta \frac{\sin \theta \rho}{\sin \theta} &= -\sum_{a} \pi \mathbb{C}_{a} \hat{K}_{a}, \\ \eta \frac{\cos \theta \rho \cos \left(2 - G^{+} + G^{-}\right) \theta - \cos \left(2\mathcal{G} - G^{+} - G^{-}\right) \theta}{\sin \theta \sin \left(2 - G^{+} + G^{-}\right) \theta} = \\ &= \mathbf{s} * \left[-2 \frac{\mathcal{X}_{2}}{1 + \mathcal{Y}_{2}} + \pi (\hat{K}_{a}^{+} - \hat{K}_{a}^{-}) \mathbb{C}_{a} - \pi \delta(u) \mathbb{C}_{1} \right], \\ \mathbb{C}_{a} &= (-1)^{a} a \mathcal{T}_{a}(0) \left(\sqrt{1 + \frac{a^{2}}{16g^{2}}} - \frac{a}{4g} \right)^{2 + 2L} \exp \left[\tilde{K}_{a} \hat{*} \log \left(\eta \frac{\sinh 2\pi u}{2\pi u} \right) \right] \end{split}$$

Step 2: Analytical ansatz for FiNLIE quantities

The way to solve FiNLIE is to make certain assumptions about its analytical properties

・ロト・日本・モート モー うへぐ

Assumptions:

- ${\ \ \ }$ $\eta(u)^2$ is meromorphic in the whole complex plane
- $\blacksquare~\eta$ has simple poles at ia/2

Step 2: Analytical ansatz for FiNLIE quantities

The way to solve FiNLIE is to make certain assumptions about its analytical properties

Assumptions:

- ${\ \ \ }$ $\eta(u)^2$ is meromorphic in the whole complex plane
- $\blacksquare \eta$ has simple poles at ia/2

Then the goal is to express the FiNLIE quantities in terms of zeros of $\eta.$ Introduce a bookkeeping function

$$\mathbf{Q}_{\pm}(x) = \prod_{k \neq 0} \frac{x_{k,\pm} - x}{x_{k,\pm}}, \ \tilde{\mathbf{Q}}_{\pm}(x) = \mathbf{Q}_{\pm}(1/x)$$

where we use Zhoukovsky transform of u: u/g = x + 1/x.

Step 2: Analytical ansatz for FiNLIE quantities

The way to solve FiNLIE is to make certain assumptions about its analytical properties

Assumptions:

- ${\ \ \ }$ $\eta(u)^2$ is meromorphic in the whole complex plane
- $\blacksquare \eta$ has simple poles at ia/2

Then the goal is to express the FiNLIE quantities in terms of zeros of $\eta.$ Introduce a bookkeeping function

$$\mathbf{Q}_{\pm}(x) = \prod_{k \neq 0} \frac{x_{k,\pm} - x}{x_{k,\pm}}, \ \tilde{\mathbf{Q}}_{\pm}(x) = \mathbf{Q}_{\pm}(1/x)$$

where we use Zhoukovsky transform of u: u/g = x + 1/x. Consequences:

$$e^{i\theta\rho} = \sqrt{\frac{\mathbf{Q}_{+}\tilde{\mathbf{Q}}_{-}}{\mathbf{Q}_{-}\tilde{\mathbf{Q}}_{+}}}, \quad \eta = \cos\theta \frac{\sqrt{\mathbf{Q}_{+}\mathbf{Q}_{-}\tilde{\mathbf{Q}}_{+}\tilde{\mathbf{Q}}_{-}}}{\tilde{C}\frac{\sinh 2\pi u}{2\pi u}}$$

▲□▶▲圖▶▲≣▶▲≣▶ ≣ のQ@

The zeros satisfy effective "crossing" Bethe equations, which can be solved by introducing a Baxter polynomial.

 $\blacksquare\ \Gamma_{cusp}$ is related to the energy of a classical open string in the limit $L\sim g\to\infty$

 $\blacksquare\ \Gamma_{cusp}$ is related to the energy of a classical open string in the limit $L\sim g\to\infty$

(ロ)、(型)、(E)、(E)、 E) の(の)

• How to take the $L \to \infty$ limit of det \mathcal{M}_{2L+1} ?

- Γ_{cusp} is related to the energy of a classical open string in the limit $L\sim g\to\infty$
- How to take the $L \to \infty$ limit of det \mathcal{M}_{2L+1} ?
- The technique of expansion in 1 over the size of the matrix is well developed in matrix models

Matrix Model reformulation

Using

$$I_n^{\theta} = \frac{1}{2\pi i} \oint \frac{dx}{x^{n+1}} \sinh(2\pi g \left(x + 1/x\right)) e^{2g\theta(x-1/x)}$$

for every element of

$$\mathcal{M}_{N} = \begin{pmatrix} I_{1}^{\theta} & I_{0}^{\theta} & \cdots & I_{2-N}^{\theta} & I_{1-N}^{\theta} \\ I_{2}^{\theta} & I_{1}^{\theta} & \cdots & I_{3-N}^{\theta} & I_{2-N}^{\theta} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ I_{N}^{\theta} & I_{N-1}^{\theta} & \cdots & I_{1}^{\theta} & I_{0}^{\theta} \\ I_{N+1}^{\theta} & I_{N}^{\theta} & \cdots & I_{2}^{\theta} & I_{1}^{\theta} \end{pmatrix}$$

we obtain

$$\det \mathcal{M}_N = \oint \prod_{i=1}^{N+1} \frac{dx_i}{2\pi i x_i^{N+2}} \frac{\Delta^2(x_i)}{(N+1)!} \sinh \left[2\pi g \left(x_i + \frac{1}{x_i} \right) \right] e^{2g\theta \left(x_i - \frac{1}{x_i} \right)}$$

In the quasi-classical approximation the value of the integral

$$\int dx_i e^{-S[x_i]}$$

is given by

$$(S''[x_i^*])^{-1/2} e^{-S[x_i^*]},$$

where x^* is a solution of a saddle-point equation $\frac{\partial S}{\partial x_i} = 0$. In the case of $L \sim g \rightarrow \infty$ limit of det \mathcal{M}_{2L+1} the saddle-point equation is

$$-\theta \frac{x_j^2 + 1}{x_j^2 - 1} + \frac{L}{g} \frac{x_j}{x_j^2 - 1} - \frac{1}{g} \frac{x_j^2}{x_j^2 - 1} \sum_{i \neq j}^{2L+1} \frac{1}{x_j - x_i} = \pi \operatorname{sgn}(\operatorname{Re}(x_j)).$$

The distribution of the roots at $L \gg 1$

The classical quasimomentum

Introduce the quantum quasimomentum p(x)

$$p(x) = -\theta \frac{x^2 + 1}{x^2 - 1} + \frac{L}{g} \frac{x}{x^2 - 1} - \frac{2L}{g} \frac{x^2}{x^2 - 1} G_L^{cl}(x),$$

where

$$G_L^{cl}(x) = \frac{1}{2L} \sum_{k=1}^{2L+1} \frac{1}{x - x_k}$$

The saddle-point equation then is

$$\frac{1}{2} \left(p(x_i + i\epsilon) + p(x_i - i\epsilon) \right) = \pi \operatorname{sgn}(\operatorname{Re}(x_i)).$$

As $L \to \infty$, the roots aggregate into two cuts and p(x) becomes a classical algebraic curve with two cuts.

The classical algebraic curve

In the classical limit p(x) becomes the classical algebraic curve.

[V.A.Kazakov, A.Marshakov, J.A.Minahan, K.Zarembo, hep-th/0402207]

Properties:

■
$$p(x) = -p(-1/x)$$

$$\bullet \ p(0) = -p(\infty) = \theta$$

• Two cuts with branch-points parametrized by
$$\{-re^{i\phi}, -re^{-i\phi}, 1/re^{i\phi}, 1/re^{-i\phi}\}$$

$$p(x_{bp}) = \pm \pi$$

Simple poles at $x = \pm 1$

Start with an ansatz for p':

$$p'(x) = \frac{A_1 x^4 + A_2 x^3 + A_3 x^2 + A_4 x + A_5}{(x^2 - 1)^2 \sqrt{x + re^{i\phi}} \sqrt{x + re^{-i\phi}} \sqrt{x - \frac{1}{r} e^{i\phi}} \sqrt{x - \frac{1}{r} e^{-i\phi}}}$$

To get p(x) we integrate and fix A_i and the integration constant using the properties above.

The classical algebraic curve

$$p(x) = \pi - 4 i \mathbb{E}(a^2 \sin^2(\phi)) \mathbb{F}_1 + 4 i \mathbb{K}(a^2 \sin^2(\phi)) \mathbb{F}_2$$
$$- a \left(\frac{x + \frac{1}{r}e^{-i\phi}}{x + re^{i\phi}}\right) \left(\frac{2r e^{i\phi}}{x^2 - 1}\right) y(x) \mathbb{K}(a^2 \sin^2(\phi)),$$

[Valatka&Sizov, to appear]

where

$$\mathbb{F}_1 = \mathbb{F}\left(\sin^{-1}\sqrt{a\left(\frac{x-\frac{1}{r}e^{-i\phi}}{x+re^{i\phi}}\right)\left(\frac{2r\,e^{2i\phi}}{e^{2i\phi}-1}\right)} \, \left| a^2\sin^2(\phi) \right),$$
$$\mathbb{F}_2 = \mathbb{E}\left(\sin^{-1}\sqrt{a\left(\frac{x-\frac{1}{r}e^{-i\phi}}{x+re^{i\phi}}\right)\left(\frac{2r\,e^{2i\phi}}{e^{2i\phi}-1}\right)} \, \left| a^2\sin^2(\phi) \right),$$

and

$$a = \frac{2r}{r^2 + 1}.$$

(ロ)、(型)、(E)、(E)、 E) のQ()

The parameters of the curve r,ϕ are related to $L/g,\theta$ by

$$\begin{aligned} \frac{L}{g} &= \frac{4}{a} \left(\mathbb{K}(a^2 \sin^2(\phi)) - \mathbb{E}(a^2 \sin^2(\phi)) \right) \\ \theta &= -\pi + \frac{4 r^2 e^{i\phi} \mathbb{K} \left(a^2 \sin^2(\phi)\right)}{r^2 + 1} \\ &- 4i \mathbb{K} \left(a^2 \sin^2(\phi)\right) \mathbb{E} \left(\sin^{-1} \left(\sqrt{\frac{e^{2i\phi}r}{-1 + e^{2i\phi}}} \sqrt{r + \frac{1}{r}} \right) \middle| a^2 \sin^2(\phi) \right) \\ &+ 4i \mathbb{E} \left(a^2 \sin^2(\phi)\right) \mathbb{F} \left(\sin^{-1} \left(\sqrt{\frac{e^{2i\phi}r}{-1 + e^{2i\phi}}} \sqrt{r + \frac{1}{r}} \right) \middle| a^2 \sin^2(\phi) \right) \end{aligned}$$

The classical energy

The energy can be expressed as an expectation value in the matrix model

$$\partial_{\theta} \log \det \mathcal{M}_L = \left\langle 2g \sum_{i=1}^{2L} (x_i - 1/x_i) \right\rangle$$

In the saddle-point approximation due to the symmetry $x \to -1/x$ only one term matters. We can express it through $G(0) \propto \sum_i \frac{1}{x_i}$,

so $\Gamma_{cusp}=-(\phi-\theta)\frac{g^2}{2}\partial_L p_L''(0).$ Using the explicit formula for p we get

$$\frac{\Gamma_{cusp}}{\phi_{cusp} - \theta_{cusp}} = g\left(r - \frac{1}{r}\right)\cos\phi$$

Notice: all the elliptic functions in p(x) got cancelled out when expressed through r and ϕ .

The same result we get considering the conserved charge of the corresponding classical string solution.

Expansion around the classical solution

Expansion in $L, g \rightarrow \infty$ with L/g fixed

$$\Gamma_L(g) = (\phi - \theta) \sum_{k=0} g^{-k} b_k \left(L/g \right)$$

- We checked that the leading terms are reproduced by our solution
- The symmetry $\Gamma_L(g) = -\Gamma_{-L-1}(-g)$ of the large L expansion [Beccaria&Macorini 1305.4839] implies that $b_1 = \frac{g}{2}\partial_L b_0$. Thus we found

$$b_1/b_0 = \frac{g}{4} \frac{\left|r^2 e^{2i\phi} + 1\right|^2 K_1 - r^2 \left|r + \frac{1}{r} + e^{i\phi} - e^{-i\phi}\right|^2 E_1,}{\left|\left(r + \frac{1}{r}\right) \left(r^2 e^{2i\phi} - 1\right) E_1 - \left(r - \frac{1}{r}\right) \left(r^2 e^{2i\phi} + 1\right) K_1\right|^2}$$

where
$$E_1 = \mathbb{E}\left(\frac{4r^2 \sin^2 \phi}{(r^2+1)^2}\right), \ K_1 = \mathbb{K}\left(\frac{4r^2 \sin^2 \phi}{(r^2+1)^2}\right)$$

 Next corrections can be generated by topological recursion work in progress by I.Kostov,N.Gromov,S.Valatka,G.S.

Conclusions

Results

- We calculated the cusp anomalous dimension in the near-BSP limit at any coupling
- Using matrix model reformulation we have found the corresponding algebraic curve and the classical limit of the cusp anomalous dimension

Remarks

- The result in a general near-BPS case $\phi\approx\theta$ is simpler than the degenerate $\theta=0$ case
- Analyticity assumption gives a key to solving TBA
- This analyticity can be derived from the novel $P \mu$ system[Gromov et al 1305.1935].
- The strong coupling expansion has a form of a matrix model expectation value
- The form of the result hints it can be derived from localization.

- The curve is related to the eigenvalues of monodromy of a flat connection around the worldsheet, though the exact procedure for an open string is not yet established
- Knowing the classical algebraic curve allows to calculate the corrections to the classical energy
- Topological recursion can be implemented for these purposes
- The relation to $P \mu$ system allows to calculate further corrections in $\phi \theta$, which may help to see a structure of the full result.
